

I need help finding a appropriate threshold for this door. This is the layout of the floor planes.

The RED is the area (threshold) I need help with.

I just put linear angles in there for reference but I am looking for best water rejection, and best seal at bottom of door from your experience.

The Threshold can be two pieces; inside and out as the floor plane inside is lower.

The seal on the bottom of the door should be something that is replaceable as I will need to apply it to the door.

Thanks for your help.
